1. Set up Documentation, Git repository, virtual environment, project directory structure, and make initial commit.
2. Install and test the local TTS model for optimal batch size and latency.
3. Implement .txt file reading.
4. Implement text chunking for longer files.
5. Implement audio generation and saving.
6. Build a basic Streamlit UI for file selection and conversion.
7. Integrate audio playback with play, pause, and timeline controls.
8. Add playback-speed control and test the complete pipeline.
